

# Case Study

## Focus on Urinals offers fiesta of water savings!

Urinals may not be on everyone's list of exciting projects, but the savings in water easily compensate for any lack of wow factor!

One customer, having installed the Enviro-Fresh reduced flushing urinal system across their automotive manufacturing plant in Essex, are on target to **save 18 million litres** of water per year! With over 3,000 employees and approximately 40 washrooms, the system is installed in around 200 urinals.

The site has been substantially expanded over the last 20 years and as part of their requirements to comply with building regulations, they looked to the Enviro-Fresh reduced flushing urinal system to reduce water use. Featuring a water management device to limit urinal flushing and a biological urinal insert to address the problems usually associated with reduced flushing, the system treats the build up of scale that causes urinal blockages and odours. After trialling many alternative products, the Enviro-Fresh system was chosen due to its superior results.

The Environmental Engineer, responsible for reducing the site's use of utilities such as energy and water, is impressed not only with the enormous savings they're making in both water use and costs, but also with the reduction in maintenance. By treating the cause of urinal blockages, the need for site maintenance staff to clear blockages on a regular basis has been greatly reduced.

*The Enviro-Fresh system... an environmentally friendly solution that enables urinal water use to be reduced without the common side-effects of increased odours and blockages. The design of the patented, biological, urinal sleeve prevents bad odours from entering the washroom. Harmful daily cleaning chemicals are replaced with bio-degradable products that are more friendly to the environment.*
