

eco-beta dual flush water saving system for WC's...

Saving water for the next generation!

eco-beta is a simple and highly effective retro-fit system which converts existing toilets (WC's) from a single flush to a dual flush system, giving users the choice of a standard full flush or a small flush.

eco-beta is WRAS approved and has been awarded the Waterwise Marque for water saving. The product has been used in water efficiency projects by a number of the UK Water companies, including Thames Water, Southern Water and Severn Trent water.

How it works

eco-beta interrupts the vacuum created when the toilet is flushed. By pressing the flush handle or button and letting go immediately, a small flush is achieved. By holding down the flush handle or button for a couple of seconds, the standard full flush is achieved. Simple "user awareness" labels are supplied with each system.

eco-beta and Enviro-Fresh

Enviro-Fresh's specialist service technicians operating from 11 branches throughout the UK will install eco-beta with minimal disruption to your washroom. Once installed, customers can immediately begin to enjoy the water savings.

The savings

- Savings of around 30-40% of WC water usage is typically achievable
- With a standard WC cisterns of 9 litres, each small flush will save approximately 4 litres of water
- Payback periods can be as little as a few months depending on occupancy and daily usage
